

DevOps – Configuration Management Tools

Configuration management Tools

ANSIBLE

CFEngine

SALTSTACK

Getting Started

- Important element that acts as a center for the DevOps is “Configuration Management”
- Practice of managing and automating all the configurations of the software applications to reduce product time
- Enable deployments and changes in applications for faster, extensible, and scalable performance

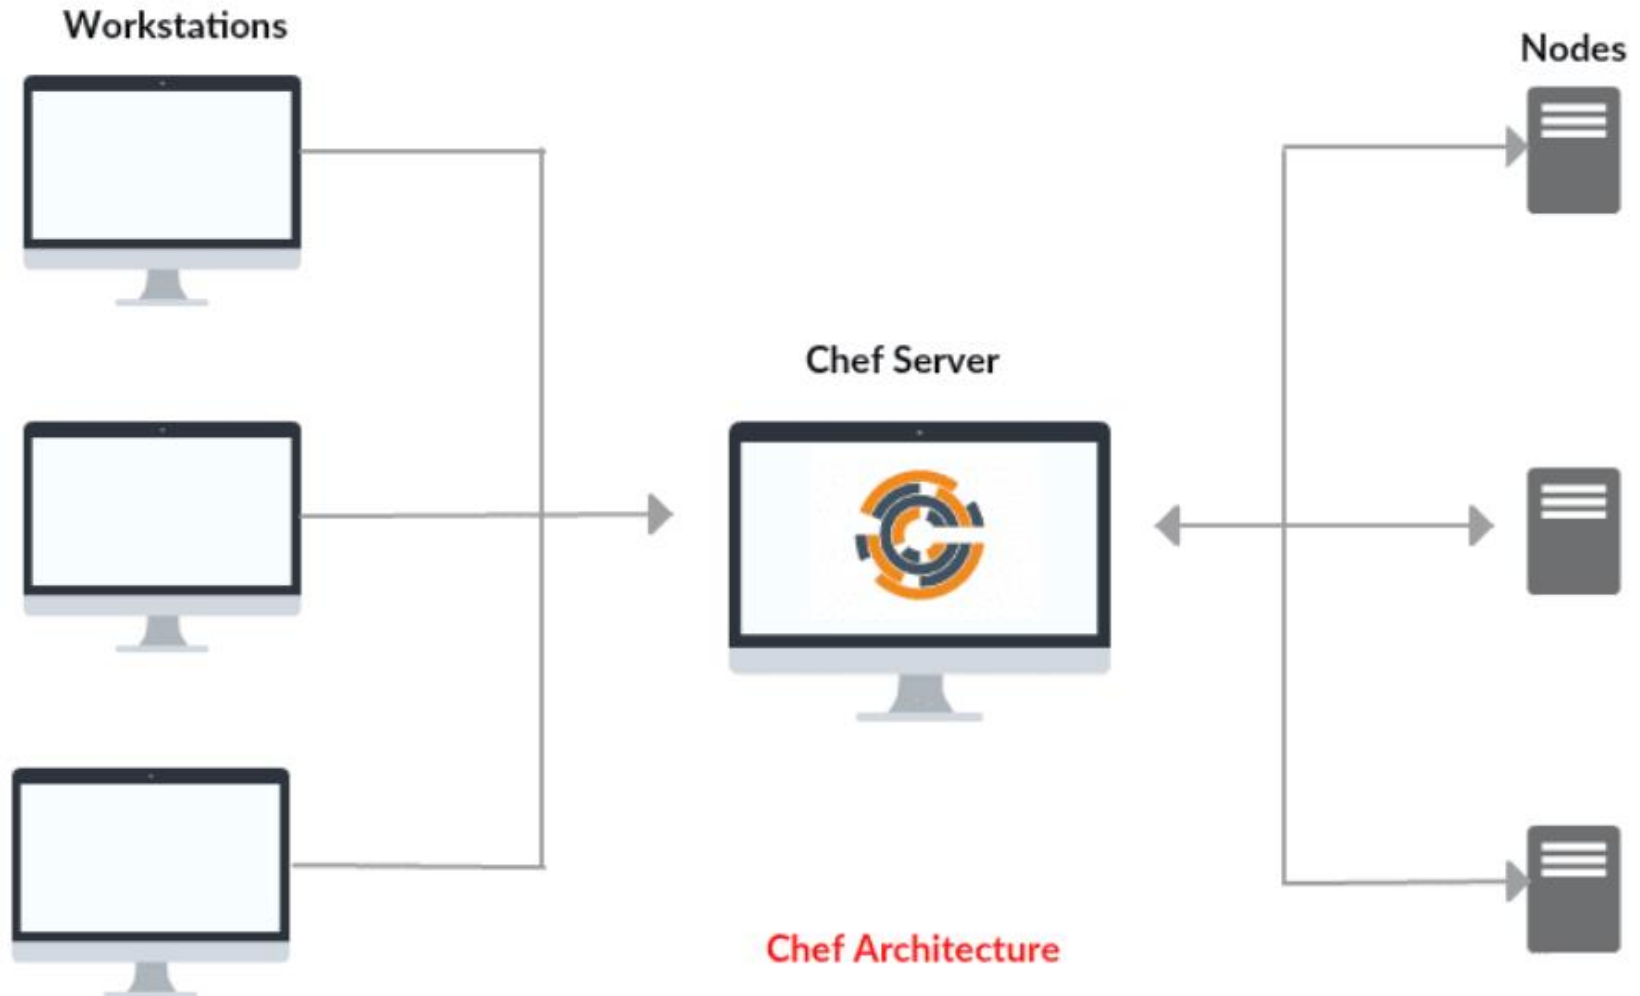

Chef - Getting Started

- Open source technology developed by Opscode
- Uses Ruby encoding to develop basic building blocks like recipe and cookbooks
- Infrastructure automation and helps in reducing manual and repetitive tasks for infrastructure management
- Used to deploy and manage servers and applications in-house and on the cloud

Components

- Chef Workstation (SDK) - Where we write recipe and Cookbook
- Chef Server - Hold Cookbook, roles, Node information and manage Nodes
- Chef Client Node - Manage by Chef Server, each deployment and configuration done by Chef Server

Chef Walkthrough

Ansible – Getting Started

- Ansible is an open source community project sponsored by Red Hat
- IT automation engine
- Used for IT tasks such as configuration management, application deployment, intra service orchestration, and provisioning
- Improve the scalability, consistency, and reliability of your IT environment

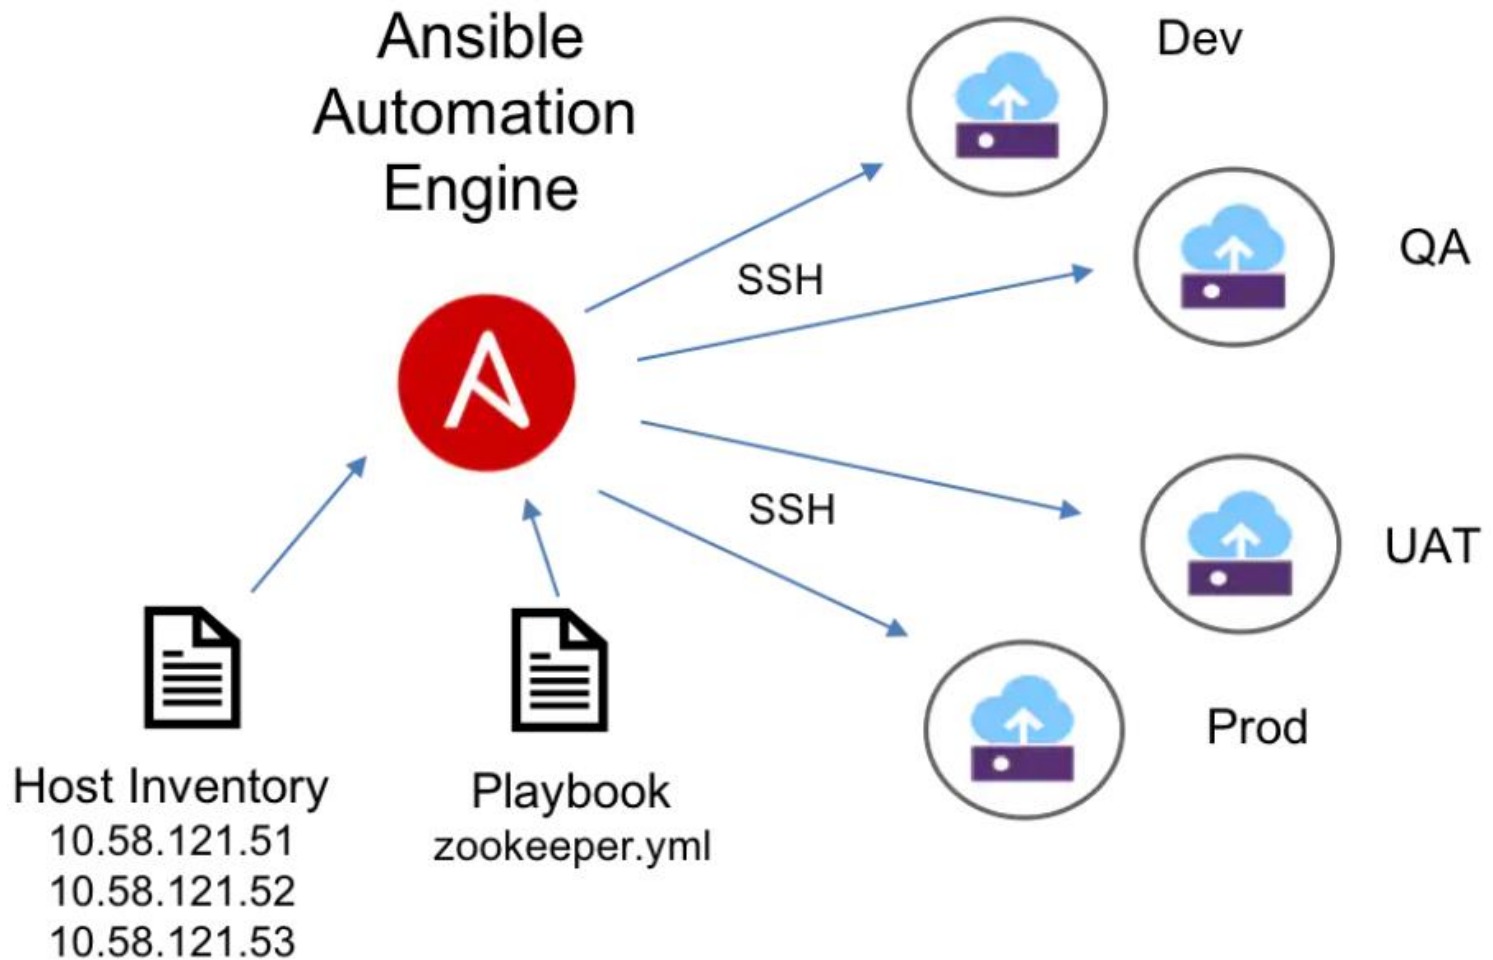

Tasks

- **Provisioning** - Set up the various servers you need in your infrastructure
- **Conf management** - Change the configuration of an application, OS, or device, start and stop services, install or update applications
- **App Deployment** - Automating the deployment of internally developed applications to your production systems
- Ansible does not use agents, but rather connects to hosts using SSH keys

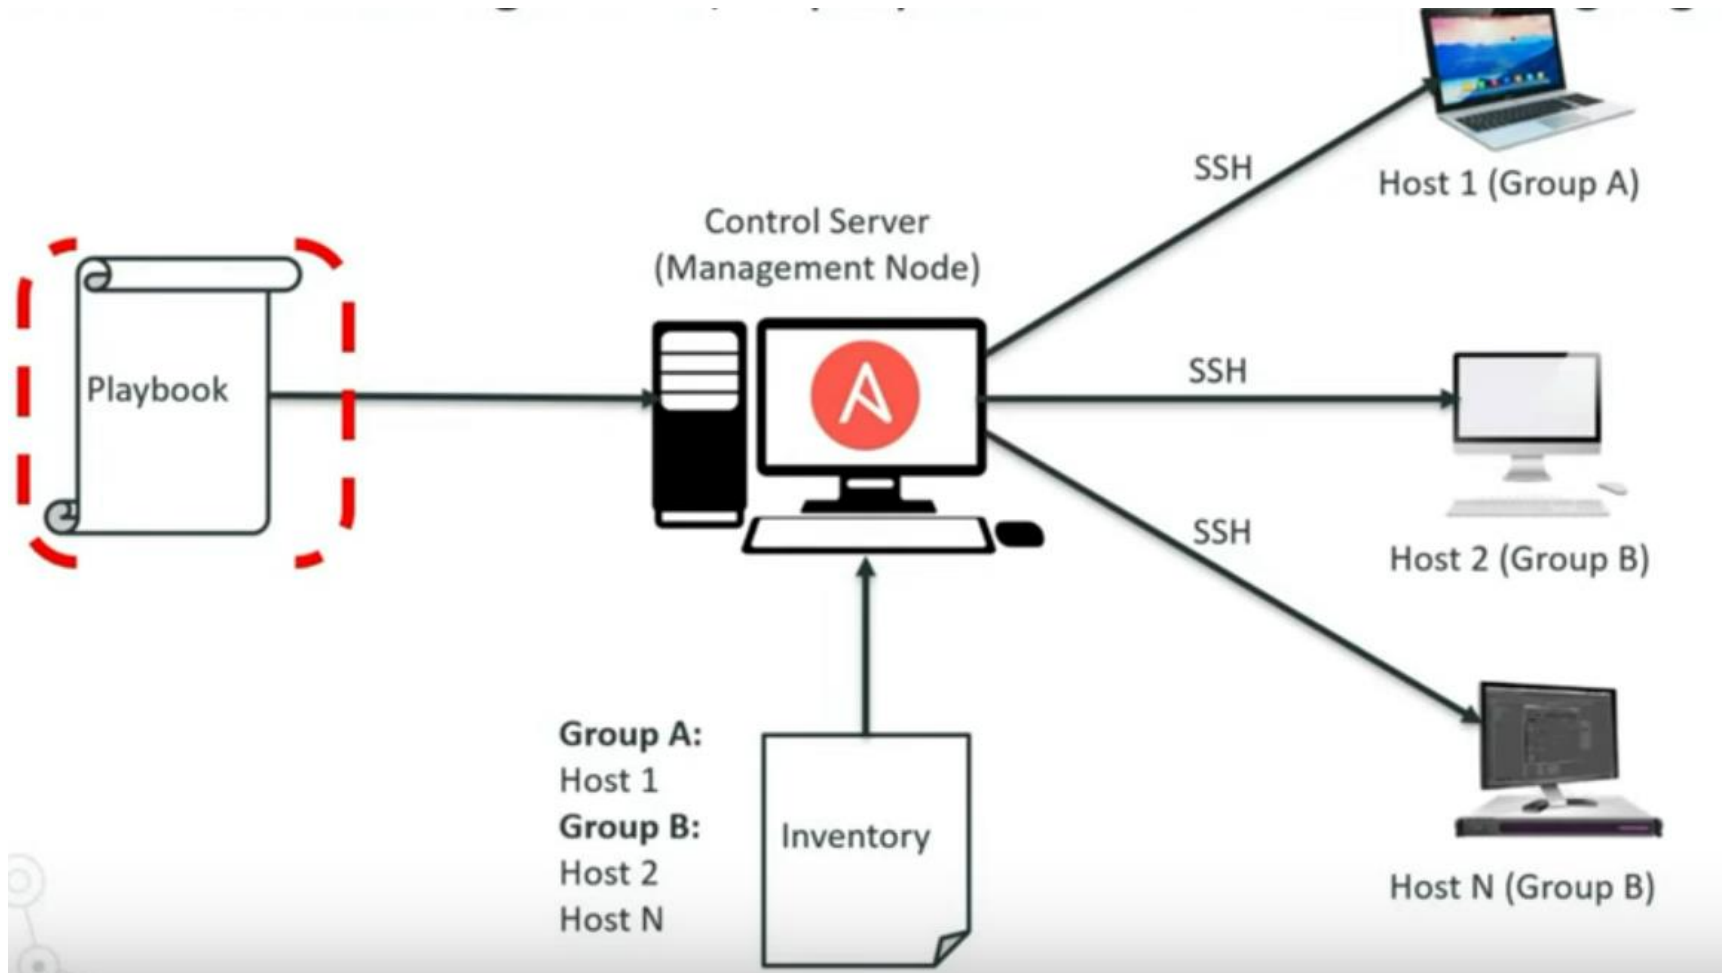

Ansible Terms

- **Controller** – Machine where Ansible is installed, and executes commands on nodes
- **Managed Node** – Machine controlled by controller
- **Task** – Single action or procedure to be executed e.g. create a file
- **Ad-hoc command** – Single task over command line represented by `-a`
- **Inventory file** – Contains information about the servers you are managing. Default file `/etc/ansible/hosts`
- **Playbook** – Ordered list of tasks for Automation using YAML
- **Module** – Common set of actions are defined. You can create own module
- **Roles** – Pre-defined playbooks which can be shared and reused
- **Handlers** – Used to trigger status change e.g. restart service after configuration change

Ansible Engine: Universal language of automation

Fueled by an open source community

Ansible Walkthrough

Difference Between Chef and Ansible

- **Chef**
 - Older
 - Better documentation, better support
 - Difficult to setup
 - Learning curve – Ruby
 - Agent – chef client need to install on nodes
 - Cookbooks for automation job
- **Ansible**
 - Simple
 - OpenSource
 - Secure – Uses ssh
 - Easy setup
 - YAML
 - Reliable
 - Agentless
 - Costly
 - Playbooks for automation job
